New Study Proves Wind Turbines Harm People

Industrial wind turbines are preventing children and families from getting sleep in their own beds, according to a new study by Dr. Nissenbaum of Northern Maine Medical Center.

The peer reviewed study released on Halloween titled *Effects of Industrial Wind Turbine Noise on Sleep and Health* reads, "We conclude that the noise emissions of Industrial Wind Turbines (IWTs) disturbed the sleep and caused daytime sleepiness and impaired mental health in residents living within 1.4 km (**9/10ths mile**) of the two IWT installations studied."

The study confirms what the wind industry has been hiding for some time, wind turbines harm people.

"Wind farms have forced Wisconsin families to move out of their homes, yet hundreds of new wind turbines are being proposed around the state. The PSC rules that regulate these huge turbines don't protect families and their pets." Senator Lasee said.

Senator Lasee said, "PSC's failure to protect kids and their puppies in their own homes is a tragedy. Wisconsin families are suffering but the PSC doesn't seem to care."

State law requires the PSC to protect citizens of Wisconsin from harmful health effects caused by Wind Turbines; unfortunately, the PSC isn't taking their responsibilities seriously.

Senator Lasee urges you to contact the Public Service Commission and the Governor to do what is required by law - to protect Wisconsin families from harm.
